BYK Chemie BYK-019

BYK-019 Defoamer is a silicone-containing defomer for waterbased coatings. BYK-019 is particularly suitable for use in waterbased coatings based on polyurethane dispersions and on polyurethane and acrylate combinations. BYK-019 is often used in the production of aqueous pigment concentrates. BYK-019 is supplied 60% solids and has a flash point of 78C.

While BYK-019 is a very good product, it is TRiiSO’s opinion that AFCONA 2503 represents a much better option. AFCONA 2503 is also a silicone-based defoamer for water-based coatings. While not a direct chemical offset, our side-by-side comparisons have demonstrated that AFCONA 2503 provides the same level of performance as BYK 019. Afcona 2503 Defoamer was designed for applications that undergo high shear during preparation and has a very high resistance to shear. Afcona 2503 is particularly suited for use in water-based coatings ranging from polyurethane dispersions to acrylic-based decorative paints. Afcona 2503 is also suitable for use in pigment concentrate preparation and high speed flexo printing applications.
