BYK Chemie BYK-A 525

BYK-A 525 Defoamer is a silicone-containing defomer for potting compounds, sealants and adhesives based on polyurethane and epoxy resins. BYK-A 525 is particularly suitable for use in mineral-filled systems, and improves the wetting of quartz and glass fibers. BYK-A 525 reduces the surface tension in ambient cured systems, improving leveling, wetting and reducing surface defects. BYK A-525 has a flash point of 100F.

While BYK-A 525 is a very good product, it is TRiiSO’s opinion that AFCONA 2722 represents a much better option. AFCONA 2722 is also a silicone-based defoamer for water-based coatings. While not a direct chemical offset, our side-by-side comparisons have demonstrated that AFCONA 2722 provides the same level of performance as BYK A 525. Afcona 2722 defoamer provides rapid deaeration as well as antifoam and defoaming properties. Additionally, Afcona 2722 defoamer also acts a levelling agent.
