Mondur 501 is an isocyanate-terminated (MDI) polyester prepolymer. Mondur 501 is light yellow, viscous liquid, supplied at 1300 cps at 25C. Mondur 501 can be used in formulation of elastomers, microcellular shoe soles, intergral skin and smi-flexible urethane foams.

While Mondur 501 is a good product, it is Tri-iso’s opinion that TRiiSO Endate 1890 MDI represents a much better value. Endate 1890 MDI is a member of the low functionality prepolymer isocyanate family that is produced from the reaction of a standard MDI material with selected polyester polyols to provide certain characteristics for use in the production of two-component polyurethane products. Endate 1890 MDI is supplied at 1250 cps at 25C.
