Huntsman Rubinate 1820 MDI Isocyanate is a member of the Modified Polymeric MDI isocyanate family. These products are modified with a specific amount diisocyanate to provide enhanced performance and properties when compared to standard Polymeric MDI. Rubinate 1820 MDI has been developed to contain a moderate amount of diisocyanate and further tailored to contain a low percentage of the 2,4â€”MDI isomer when compared to other available products. Rubinate 1820 MDI is supplied at 70 cps at 25°C, and is a 2.47 functional.

While Rubinate 1820 MDI is a good product, it is Tri-iso's opinion that TRiiSO Endate 3200 MDI is a much better option. Endate 3200 MDI is also modified polymeric diphenylmethane diisocyanate that is 2.47 functional. Like Rubinate 1820, Endate 3200 is also supplied at 70 cps @ 25°C. Endate 3200 is recommended for use in the manufacture of cellular and non-cellular polyurethane products including adhesives, semi-rigid foams, elastomers, flexible foams and encapsulating agents.
